# What is the Problem...?

## What is the Problem...?

- ▶ **Consider an investor who has the possibility of investing in  $n$  different risky assets**

$$\mathbf{X} = (X_1, X_2, \dots, X_n)$$

## What is the Problem...?

- ▶ **Consider an investor who has the possibility of investing in  $n$  different risky assets**

$$\mathbf{X} = (X_1, X_2, \dots, X_n)$$

- ▶ **The investor has to allocate his budget  $C$  to the different risks. Without loss of generality  $C = 1$**

## What is the Problem...?

- ▶ Consider an investor who has the possibility of investing in  $n$  different risky assets

$$\mathbf{X} = (X_1, X_2, \dots, X_n)$$

- ▶ The investor has to allocate his budget  $C$  to the different risks. Without loss of generality  $C = 1$
- ▶ The investor has many alternatives to invest given by

$$\mathbf{w} = (\omega_1, \omega_2, \dots, \omega_n), \quad \sum_{i=1}^n \omega_i = 1, \quad \omega_i \geq 0, \quad i = 1, \dots, n,$$

where  $\omega_i$  is the weight (**budget proportion**) assigned to the risk  $X_i$ .

# What is the Problem...?

- ▶ **The portfolio is the random variable**

$$\mathcal{P}_{\mathbf{w}} = \sum_{i=1}^n \omega_i X_i$$

# What is the Problem...?

- ▶ **The portfolio is the random variable**

$$\mathcal{P}_{\mathbf{w}} = \sum_{i=1}^n \omega_i X_i$$

- ▶ **Given**

$$\mathbf{X} = (X_1, X_2, \dots, X_n)$$

**How does the investor find the best portfolio...?**

## What is the Problem...?

- ▶ **The portfolio is the random variable**

$$\mathcal{P}_{\mathbf{w}} = \sum_{i=1}^n \omega_i X_i$$

- ▶ **Given**

$$\mathbf{X} = (X_1, X_2, \dots, X_n)$$

**How does the investor find the best portfolio...?**

- ▶ **Some answers will be given in this talk**

## What is the Problem...?

- ▶ **Assume that an investor cares only about the mean and variance of portfolio.**
- ▶ **A simple case of two risks**

$$\mathbf{X} = (X_1, X_2) \text{ such that } E(\mathbf{X}) = (\mu_1, \mu_2) \text{ and } \Sigma = \begin{pmatrix} \sigma_1^2 & \sigma_{12} \\ \sigma_{12} & \sigma_2^2 \end{pmatrix}$$

## What is the Problem...?

- ▶ **Assume that an investor cares only about the mean and variance of portfolio.**
- ▶ **A simple case of two risks**

$$\mathbf{X} = (X_1, X_2) \text{ such that } E(\mathbf{X}) = (\mu_1, \mu_2) \text{ and } \Sigma = \begin{pmatrix} \sigma_1^2 & \sigma_{12} \\ \sigma_{12} & \sigma_2^2 \end{pmatrix}$$

- ▶ **Let  $\mathbf{w} = (\omega_1, \omega_2)$  be the vector of portfolio weights. Clearly the portfolio is**

$$\mathcal{P}_{\mathbf{w}} = \omega_1 X_1 + \omega_2 X_2 = \omega X_1 + (1 - \omega) X_2, \quad 0 \leq \omega \leq 1.$$

## What is the Problem...?

- ▶ **Assume that an investor cares only about the mean and variance of portfolio.**
- ▶ **A simple case of two risks**

$$\mathbf{X} = (X_1, X_2) \text{ such that } E(\mathbf{X}) = (\mu_1, \mu_2) \text{ and } \Sigma = \begin{pmatrix} \sigma_1^2 & \sigma_{12} \\ \sigma_{12} & \sigma_2^2 \end{pmatrix}$$

- ▶ **Let  $\mathbf{w} = (\omega_1, \omega_2)$  be the vector of portfolio weights. Clearly the portfolio is**

$$\mathcal{P}_{\mathbf{w}} = \omega_1 X_1 + \omega_2 X_2 = \omega X_1 + (1 - \omega) X_2, \quad 0 \leq \omega \leq 1.$$

- ▶  $E(\mathcal{P}_{\mathbf{w}}) = \omega \mu_1 + (1 - \omega) \mu_2$

$$VAR(\mathcal{P}_{\mathbf{w}}) = \omega^2 \sigma_1^2 + (1 - \omega)^2 \sigma_2^2 + 2\omega(1 - \omega) \sigma_{12}$$

## What is the Problem...?

Let  $\mathbf{X} = (X_1, X_2)$  such that

$\mu_1 = 0.5$ ,  $\mu_2 = 0.3$ ,  $\sigma_1^2 = 4$ ,  $\sigma_2^2 = 1$ ,  $\sigma_{12} = 1$ . **If  $\omega = 1$** , then

$$\mathcal{P}_{\mathbf{w}} = \omega X_1 + (1 - \omega)X_2 = X_1$$

$$E(\mathcal{P}_{\mathbf{w}}) = \omega\mu_1 + (1 - \omega)\mu_2 = 0.5$$

$$VAR(\mathcal{P}_{\mathbf{w}}) = \omega^2\sigma_1^2 + (1 - \omega)^2\sigma_2^2 + 2\omega(1 - \omega)\sigma_{12} = 4$$

## What is the Problem...?

Let  $\mathbf{X} = (X_1, X_2)$  such that

$\mu_1 = 0.5$ ,  $\mu_2 = 0.3$ ,  $\sigma_1^2 = 4$ ,  $\sigma_2^2 = 1$ ,  $\sigma_{12} = 1$ . **If  $\omega = 1$** , then

$$\mathcal{P}_{\mathbf{w}} = \omega X_1 + (1 - \omega)X_2 = X_1$$

$$E(\mathcal{P}_{\mathbf{w}}) = \omega\mu_1 + (1 - \omega)\mu_2 = 0.5$$

$$VAR(\mathcal{P}_{\mathbf{w}}) = \omega^2\sigma_1^2 + (1 - \omega)^2\sigma_2^2 + 2\omega(1 - \omega)\sigma_{12} = 4$$

## What is the Problem...?

Let  $\mathbf{X} = (X_1, X_2)$  such that

$\mu_1 = 0.5$ ,  $\mu_2 = 0.3$ ,  $\sigma_1^2 = 4$ ,  $\sigma_2^2 = 1$ ,  $\sigma_{12} = 1$ . **If  $\omega = 0$** , then

$$\mathcal{P}_{\mathbf{w}} = \omega X_1 + (1 - \omega)X_2 = X_2$$

$$E(\mathcal{P}_{\mathbf{w}}) = \omega\mu_1 + (1 - \omega)\mu_2 = 0.3$$

$$VAR(\mathcal{P}_{\mathbf{w}}) = \omega^2\sigma_1^2 + (1 - \omega)^2\sigma_2^2 + 2\omega(1 - \omega)\sigma_{12} = 1$$

## What is the Problem...?

Let  $\mathbf{X} = (X_1, X_2)$  such that

$\mu_1 = 0.5$ ,  $\mu_2 = 0.3$ ,  $\sigma_1^2 = 4$ ,  $\sigma_2^2 = 1$ ,  $\sigma_{12} = 1$ . **If  $\omega = 0.5$** , then

$$\mathcal{P}_{\omega} = \omega X_1 + (1 - \omega) X_2 = 0.5 X_1 + 0.5 X_2$$

$$E(\mathcal{P}_{\omega}) = \omega \mu_1 + (1 - \omega) \mu_2 = 0.75$$

$$VAR(\mathcal{P}_{\omega}) = \omega^2 \sigma_1^2 + (1 - \omega)^2 \sigma_2^2 + 2\omega(1 - \omega)\sigma_{12} = 0.87$$

# Elliptical Distributions

## Definition

The random vector  $\mathbf{X} = (X_1, \dots, X_n)'$  is said to have an **elliptical distribution** with parameters  $\mu$  and  $\Sigma$  if its characteristic function can be expressed as

$$E[\exp(it'X)] = \exp(it'\mu)\phi(t'\Sigma t), \quad \mathbf{t} = (t_1, \dots, t_n)', \quad (3)$$

for some function  $\phi$ , and if  $\Sigma$  is such that  $\Sigma = \mathbf{A}\mathbf{A}'$  for some matrix  $\mathbf{A}(n \times m)$ .

# Property

Laniado et al. (2012)

**Let  $\mathbf{X} = (X_1, X_2)$  be a random vector elliptically distributed with parameters  $\mu = 0$  and  $\Sigma_{\mathbf{X}}$ . Then there exists a rotation matrix such that  $\mathcal{R}\mathbf{X}$  is exchangeable.**

# Property

Laniado et al. (2012)

**Let  $\mathbf{X} = (X_1, X_2)$  be a random vector elliptically distributed with parameters  $\mu = 0$  and  $\Sigma_{\mathbf{X}}$ . Then there exists a rotation matrix such that  $\mathcal{R}\mathbf{X}$  is exchangeable.**

$$\mathcal{R} = \frac{\sqrt{2}}{2} \begin{pmatrix} q_{11} + q_{21} & q_{21} - q_{11} \\ q_{11} - q_{21} & q_{11} + q_{21} \end{pmatrix}.$$

$\Sigma_{\mathbf{X}} = QDQ'$  and  $Q = (q_{ij})$

# Rotated Elliptical Distribution

### Theorem 3.A.35. Shaked and Shanthikumar (2007)

**Let  $X_1, \dots, X_n$  be exchangeable random variables. Let  $\mathbf{a} = (a_1, \dots, a_n)'$  and  $\mathbf{b} = (b_1, \dots, b_n)'$  such that  $\mathbf{a} \prec \mathbf{b}$ , then**

$$\sum_{i=1}^n a_i X_i \geq_{cv} \sum_{i=1}^n b_i X_i$$

### Laniado et al. (2012)

**Let  $\mathbf{X} = (X_1, X_2)'$  be elliptically distributed such that  $E\mathbf{X} = \mathbf{0}$  and let  $\mathbf{a} = (a_1, a_2)'$  and  $\mathbf{b} = (b_1, b_2)'$  be two vectors of constants. If  $\mathbf{a} \prec \mathbf{b}$ , then**

$$\mathbf{a}'\mathcal{R}\mathbf{X} \geq_{cv} \mathbf{b}'\mathcal{R}\mathbf{X}.$$

### Theorem 3.A.35. Shaked and Shanthikumar (2007)

**Let  $X_1, \dots, X_n$  be exchangeable random variables. Let  $\mathbf{a} = (a_1, \dots, a_n)'$  and  $\mathbf{b} = (b_1, \dots, b_n)'$  such that  $\mathbf{a} \prec \mathbf{b}$ , then**

$$\sum_{i=1}^n a_i X_i \geq_{cv} \sum_{i=1}^n b_i X_i$$

### Laniado et al. (2012)

**Let  $\mathbf{X} = (X_1, X_2)'$  be elliptically distributed such that  $E\mathbf{X} = \mathbf{0}$  and let  $\mathbf{a} = (a_1, a_2)'$  and  $\mathbf{b} = (b_1, b_2)'$  be two vectors of constants. If  $\mathbf{a} \prec \mathbf{b}$ , then**

$$\mathbf{a}'\mathcal{R}\mathbf{X} \geq_{cv} \mathbf{b}'\mathcal{R}\mathbf{X}.$$

**For any concave function  $f$**

$$Ef(\mathbf{a}'\mathcal{R}\mathbf{X}) \geq Ef(\mathbf{b}'\mathcal{R}\mathbf{X}).$$

### Theorem 3.A.35. Shaked and Shanthikumar (2007)

Let  $X_1, \dots, X_n$  be exchangeable random variables. Let  $\mathbf{a} = (a_1, \dots, a_n)'$  and  $\mathbf{b} = (b_1, \dots, b_n)'$  such that  $\mathbf{a} \prec \mathbf{b}$ , then

$$\sum_{i=1}^n a_i X_i \geq_{cv} \sum_{i=1}^n b_i X_i$$

### Laniado et al. (2012)

Let  $\mathbf{X} = (X_1, X_2)'$  be elliptically distributed such that  $E\mathbf{X} = \mathbf{0}$  and let  $\mathbf{a} = (a_1, a_2)'$  and  $\mathbf{b} = (b_1, b_2)'$  be two vectors of constants. If  $\mathbf{a} \prec \mathbf{b}$ , then

$$\mathbf{a}'\mathcal{R}\mathbf{X} \geq_{cv} \mathbf{b}'\mathcal{R}\mathbf{X}.$$

For any concave function  $f$

$$EU(\mathbf{a}'\mathcal{R}\mathbf{X}) \geq EU(\mathbf{b}'\mathcal{R}\mathbf{X}).$$

In particular for an utility function  $U$

## Elliptical Distribution, $n > 2$

### Property

**Let  $\mathbf{X} = (X_1, \dots, X_n)'$  be a random vector elliptically distributed with parameters  $\mu_{\mathbf{X}} = 0$  and  $\Sigma_{\mathbf{X}}$  is such that it has at least  $n - 1$  equal eigenvalues given by  $\lambda_1 \geq \lambda_2 = \dots = \lambda_n = \lambda > 0$ . Then there exists a rotation matrix  $\mathcal{R}$  such that  $\mathcal{R}\mathbf{X}$  has exchangeable components.**

## Elliptical Distribution, $n > 2$

### Property

**Let  $\mathbf{X} = (X_1, \dots, X_n)'$  be a random vector elliptically distributed with parameters  $\mu_{\mathbf{X}} = 0$  and  $\Sigma_{\mathbf{X}}$  is such that it has at least  $n - 1$  equal eigenvalues given by  $\lambda_1 \geq \lambda_2 = \dots = \lambda_n = \lambda > 0$ . Then there exists a rotation matrix  $\mathcal{R}$  such that  $\mathcal{R}\mathbf{X}$  has exchangeable components.**

**If  $\mathbf{a} = (a_1, \dots, a_n)'$  is majorized by  $\mathbf{b} = (b_1, \dots, b_n)'$ , then**

$$\mathbf{a}'\mathcal{R}\mathbf{X} \geq_{cv} \mathbf{b}'\mathcal{R}\mathbf{X}$$

**For any concave function  $f$**

$$EU(\mathbf{a}'\mathcal{R}\mathbf{X}) \geq EU(\mathbf{b}'\mathcal{R}\mathbf{X}).$$

**In particular for an utility function  $U$**

# Portafolio Comparison

Shaked and Shanthikumar (2007)

$$X \leq_{st} Y \iff E[\phi(X)] \leq E[\phi(Y)],$$

**for all increasing function  $\phi$  for which the expectation exist.**

# Portafolio Comparison

Shaked and Shanthikumar (2007)

$$X \leq_{st} Y \iff E[\phi(X)] \leq E[\phi(Y)],$$

**for all increasing function  $\phi$  for which the expectation exist.**

**Therefore, given the portfolios  $\mathcal{P}_{\omega_1}$  and  $\mathcal{P}_{\omega_2}$  such that**

$$\mathcal{P}_{\omega_1} \leq_{st} \mathcal{P}_{\omega_2},$$

**then an investor with increasing utility function prefers  $\mathcal{P}_{\omega_2}$ .**

# Portfolio Comparison

Shaked and Shanthikumar (2007)

$$X \leq_{icx} Y \iff E[\phi(X)] \leq E[\phi(Y)],$$

**for all increasing concave function  $\phi$  for which the expectation exist.**

# Portafolio Comparison

Shaked and Shanthikumar (2007)

$$X \leq_{icx} Y \iff E[\phi(X)] \leq E[\phi(Y)],$$

**for all increasing concave function  $\phi$  for which the expectation exist.**

**Therefore, given the portfolios  $\mathcal{P}_{\omega_1}$  and  $\mathcal{P}_{\omega_2}$  such that**

$$\mathcal{P}_{\omega_1} \leq_{icv} \mathcal{P}_{\omega_2},$$

**then an investor with increasing and concave utility function prefers  $\mathcal{P}_{\omega_2}$ .**

# Portfolio Problem

$$\max_{\vec{\omega}} E\mathfrak{U}(\mathcal{P}_{\omega}) \quad \text{s.t.} \quad \sum_{i=1}^n \omega_i = 1. \quad (4)$$

# Portfolio Problem

$$\max_{\vec{\omega}} E\mathfrak{U}(\mathcal{P}_{\omega}) \quad \text{s.t.} \quad \sum_{i=1}^n \omega_i = 1. \quad (4)$$

Müller and Stoyan (2002)

**If  $X_1, \dots, X_n$  are independent with**

$$X_1 \geq_{lr} X_2 \geq_{lr} \dots \geq_{lr} X_n,$$

**and  $\mathfrak{U}$  is increasing. Then the optimization problem (4) has an optimal solution with  $\omega_1 \geq \omega_2 \geq \dots \geq \omega_n$ .**

# Portfolio Problem

$$\max_{\vec{\omega}} E\mathfrak{U}(\mathcal{P}_{\omega}) \quad \text{s.t.} \quad \sum_{i=1}^n \omega_i = 1. \quad (4)$$

Müller and Stoyan (2002)

If  $X_1, \dots, X_n$  are independent with

$$X_1 \geq_{lr} X_2 \geq_{lr} \dots \geq_{lr} X_n,$$

and  $\mathfrak{U}$  is increasing. Then the optimization problem (4) has an optimal solution with  $\omega_1 \geq \omega_2 \geq \dots \geq \omega_n$ .

Shaked and Shanthikumar (2007)

$$X \leq_{lr} Y \iff \frac{f_Y(t)}{f_X(t)} \uparrow_t$$

# Portfolio Problem

$$\max_{\vec{\omega}} E\mathcal{U}(\mathcal{P}_{\omega}) \quad \text{s.t.} \quad \sum_{i=1}^n \omega_i = 1. \quad (5)$$

Müller and Stoyan (2002)

**If  $X_1, \dots, X_n$  are independent with**

$$X_1 \geq_{rh} X_2 \geq_{rh} \dots \geq_{rh} X_n,$$

**and  $\mathcal{U}$  is increasing and concave. Then the optimization problem (5) has an optimal solution with.  $\omega_1 \geq \omega_2 \geq \dots \geq \omega_n$ .**

# Portfolio Problem

$$\max_{\vec{\omega}} E\mathcal{U}(\mathcal{P}_{\omega}) \quad \text{s.t.} \quad \sum_{i=1}^n \omega_i = 1. \quad (5)$$

Müller and Stoyan (2002)

If  $X_1, \dots, X_n$  are independent with

## Conclusions

- ▶ Find good estimation for the variance and covariance matrix
- ▶ Consider the the result of the PIR strategy for high dimensions
- ▶ **Study conditions under which some other distributions can be exchangeable through rotations.**

## Conclusions

- ▶ Find good estimation for the variance and covariance matrix
- ▶ Consider the the result of the PIR strategy for high dimensions
- ▶ Study conditions under which some other distributions can be exchangeable through rotations.
- ▶ To face the portfolio problem considering other interesting measure risk.
